

23. The human body contains

- (a) about 70% water (b) 20% - 30% water
(c) 10%-20% water (d) 30%-40% water
(e) None of the above / More than one of the above

64th B.P.S.C. (Pre) 2018

Ans. (a)

Most part of our body is made up of water. The amount of water present in the human body about two-third (about 70%).

24. A substance added to food containing fats and oils is called

- (a) oxidant (b) rancid
(c) antioxidant (d) None of the above

BPSC Agriculture Department-2024

Ans. (c)

The substance added to food containing fats and oils is called an antioxidant. Antioxidants are added to food to prevent fats and oils from oxidizing, which is also known as rancidity. This process can spoil the appearance and nutritional value of food.

IV. Circulatory System

1. The most important cell type associated with the immunity of the body is

- (a) RBCs (b) platelets
(c) lymphocytes (d) More than one of the above
(e) None of the above

68th B.P.S.C. (Pre) 2022

Ans. (c)

The most important cell type associated with the immunity of the body is Lymphocytes.
Lymphocytes are a type of immune cell that is made in the bone marrow and is found in the blood and Lymph tissue. The two main types of lymphocytes are B-lymphocytes and T-lymphocytes. B-lymphocytes make antibodies, and T-lymphocytes control immune response.

2. In transfusion, blood must be compatible not only in blood type, but also in -

- (a) Rh factor
(b) the number of white cells
(c) the number of red cells
(d) race of the donor and recipient
(e) none of the above / more than one of the above

67th B.P.S.C. (Pre) 2021

Ans. (a)

The Rh factor must also be compatible with the blood type in a blood transfusion. The Rh factor was discovered by Karl Landsteiner and A.S. Weiner in the blood of rhesus monkeys.

3. The total volume of blood in a normal adult human being is

- (a) 5-6 litres (b) 3-4 litres
(c) 8-10 litres (d) 10-12 litres

56th to 59th B.P.S.C. (Pre) 2015

Ans. (a)

Blood is a fluid connective tissue consisting of blood corpuscles and plasma. The total volume of blood in a 70 kg normal adult human being is 5-6 litres.

4. Blood platelets help in

- (a) manufacture of RBC (b) blood clotting
(c) manufacture of WBC (d) More than one of the above
(e) None of the above

B.P.S.C. School Teacher (Class 9-10) 07-12-2023

Ans. (b)

Platelets are tiny blood cells that helps our body from clots to stop bleeding. If one of our blood vessels get damage it sends out signals to the platelets. The platelets then rush to the side of damaged and form a plug (clot) to fix the damage.

5. Which among the following help in circulation of blood?

- (a) Lymphocytes (b) Monocytes
(c) Erythrocytes (d) Blood platelets
(e) None of the above/More than one of the above

66th B.P.S.C. (Pre) (Re. Exam) 2020

Ans. (c)

Erythrocytes (RBCs : Red blood corpuscles) help in circulation of blood. RBCs contain haemoglobin, a protein that gives blood its red colour and enables it to carry oxygen from the lungs and deliver it to all body tissues. Oxygen is used by cells to produce energy that the body needs, leaving carbon dioxide as a waste product. RBCs also carry carbon dioxide away from the tissues and back to the lungs.

6. Myoglobin contains the metal –

- (a) Copper (b) Silver
(c) Gold (d) Iron

47th B.P.S.C. (Pre) 2005

Ans. (d)

Myoglobin is an oxygen-binding heme protein found in the skeletal muscle tissue of vertebrates in general and in almost all mammals. It contains iron (Fe). It is distantly related to haemoglobin. Compared to haemoglobin, myoglobin has a higher affinity for oxygen and does not have cooperative binding with oxygen like haemoglobin does.
