

VII. Endocrine System

1. Insulin is :

- (a) Fat
- (b) Vitamin
- (c) Carbohydrate
- (d) Protein
- (e) None of the above/More than one of the above.

60th to 62nd B.P.S.C. (Pre) 2016

Ans. (d)

Insulin is a protein chain or peptide hormone produced by the beta cells of the pancreatic islets of Langerhans and it is considered to be the main anabolic hormone of the body. In chemical terms it is a micro peptide that is composed of 51 amino acids. It regulates the metabolism of carbohydrates, fats and protein by promoting the absorption of glucose from the blood into liver, fat and skeletal muscle cells in the body.

2. Which hormone is produced in pancreas?

- (a) Thyroxine
- (b) Insulin
- (c) Galanin
- (d) Gastrin
- (e) None of the above/More than one of the above

66th B.P.S.C. (Pre) (Re. Exam) 2020

Ans. (b)

See the explanation of the above question.

3. Which of the following is a hormone?

- (a) RNA
- (b) Invertase
- (c) Insulin
- (d) Ascorbic acid

46th B.P.S.C. (Pre) 2004

Ans. (c)

See the explanation of the above question.

4. In human system, insulin controls the metabolism of :

- (a) Fats
- (b) Carbohydrates
- (c) Proteins
- (d) Nucleic acids
- (e) None of the above/More than one of the above

63rd B.P.S.C. (Pre) 2017

Ans. (e)

See the explanation of the above question. B.P.S.C. had given option (b) as the answer of this question in his final answer key, which is not appropriate.

5. Insulin is received from -

- (a) Rhizome of ginger
- (b) Roots of dahlia
- (c) Balsam flower
- (d) Potatoes tuber

39th B.P.S.C. (Pre) 1994

Ans. (b)

Insulin is a hormone which plays an important role in the regulation of blood glucose level. The main source of insulin are from the roots of dahlias and beta (β) cells of the pancreas.

6. Which of the following hormones play a role in release of milk from mammary glands?

- (a) Adrenaline
- (b) Thyroxine
- (c) Progesterone
- (d) Oxytocin
- (e) None of the above/More than one of the above

60th to 62nd B.P.S.C. (Pre) 2016

Ans. (d)

Oxytocin has two target tissues- women's uterus and their breast. Oxytocin facilitate the contraction of uterus and dilatation of cervix during labour and stimulates the nipples for breast-feeding. Oxytocin also plays a role in release of milk from mammary glands.

7. Which of the following hormones contains iodine?

- (a) Testosterone
- (b) Adrenaline
- (c) Thyroxine
- (d) Insulin
- (e) None of the above/More than one of the above

65th B.P.S.C. (Pre) 2019

Ans. (c)

The thyroid gland is located in the front of the neck attached to the lower part of the voice box (larynx) and to the upper part of the windpipe (trachea). The thyroid gland produces thyroid hormones-thyroxine (T_4) and triiodothyronine (T_3). These are iodine containing hormones. Thyroid cells combine iodine and the amino acid tyrosine to make thyroxine (T_4) and triiodothyronine (T_3) hormones. T_4 molecule contains four iodine atoms while T_3 molecule have three iodine atoms.

8. Which one among the following glands is present in pair in human body?

- (a) Adrenal
- (b) Liver
- (c) Pancreas
- (d) Pineal
- (e) None of the above/More than one of the above

B.P.S.C. CDPO 2018

Ans. (a)

In human beings, Adrenal glands are present in pair. Each gland is located at the anterior portion of each kidney. While Liver, Pancreas and Pineal glands are not found in pairs.

9. Which hormone stimulates the thyroid gland to secrete thyroxine?

- (a) TSH
- (b) FSH
- (c) LTH
- (d) ACTH

45th B.P.S.C. (Pre) 2001

Ans. (a)

The hormonal output from the thyroid is regulated by Thyroid-Stimulating Hormone (TSH) produced by the anterior pituitary.
