

Code:

	A	B	C	D
(a)	3	4	2	1
(b)	4	2	3	1
(c)	4	3	1	2
(d)	3	1	4	2

R.A.S./R.T.S. (Pre) 2018

Ans. (c)

(Mountain Peak)	(Location/Country)
Elbrus	- Russia
Kilimanjaro	- Tanzania
Mt. Cook	- New Zealand
McKinley	- U.S.A.

Elbrus is an extinct volcano in the Caucasus Mountains in Southern Russia. It is considered to be the highest mountain in Europe. Its elevation is 5642 m. above sea level.

Mount Kilimanjaro with its three volcanic cones, Kibo, Mawenzi and Shira is a dormant volcano in Tanzania. It is the highest mountain in Tanzania. Its elevation is 5895 m above sea level.

Mount Cook or Aoraki is the highest mountain in New Zealand. It lies in the Southern Alps. Its elevation is 3,724 m above sea level.

Mount McKinley also known as Denali is the highest mountain peak in North America, located in the Alaska Range in the interior of the U.S. state of Alaska. Its elevation is 6190 m above sea level.

47. Match List-I with List-II and select the correct answer from the codes given below:

List-I (Mountain)	List-II (Country)
A. Atlas	1. France/Spain
B. Kilimanjaro	2. Ecuador
C. Chimborazo	3. Tanzania
D. Pyrenees	4. Morocco

Codes :

	A	B	C	D
(a)	4	3	2	1
(b)	4	1	2	3
(c)	2	3	4	1
(d)	1	3	4	2

U.P. P.C.S. (Pre) 2020

Ans. (a)

The correct match of mountains and their location is as follows:	
(Mountain)	(Country)
Atlas	Morocco
Kilimanjaro	Tanzania
Chimborazo	Ecuador
Pyrenees	France/Spain

48. Which is the mountain range along the Mediterranean Coast of Asia Minor ?

- (a) Kirther (b) Alburg
(c) Taurus (d) Pontic

70th B.P.S.C. Re-Exam 2024

Ans. (c)

The Taurus Mountains extend along the Mediterranean coast of Asia Minor (modern-day Turkey). This mountain range forms the southern boundary of the Anatolian plateau.

49. Epeirogenic forces are result of :

- (a) Horizontal earth movements
(b) Vertical earth movements
(c) Mass movements
(d) Displacement

Uttarakhand P.C.S. (Pre) 2024

Ans. (b)

The forces that cause physical and chemical changes on Earth's surface are known as geomorphic processes. All changes occur under the influence of certain forces that continuously act within the Earth as well as on its surface. Forces acting on the Earth's surface are called exogenic forces, while those operating inside the Earth are termed endogenic forces. Among the endogenic forces, epeirogenic forces cause uplift and emergence due to upward movement in large parts of the Earth's crust and subsidence and sinking due to downward movement. These two process are indicative of the vertical movement of the Earth's crust.

The Plateaus

*A plateau, also called a high plain or a tableland, is an area of a highland usually consisting of relatively flat terrain, that is raised significantly above the surrounding area, often with one or more sides with steep slopes. They are second to mountains in terms of elevation and second to plains in terms of regional expansion.

*Plateaus can be formed by a number of processes-

Glacial Plateau- Plateaus formed by the erosional and depositional processes of glaciers on mountain ranges, making their tops flat and sitting between other mountain ranges. In Germany, the plateau of Prussia is a glacial plateau. Similarly the 'Marg' of Kashmir in India is of glacial nature.

Fluvial Plateau- These plateaus have been formed by continuous deposits of fluvial sediments brought by the rivers.

The **Vindhya Plateau**, **Shillong Plateau** of India, **Shan Plateau** of Myanmar are some examples of Fluvial Plateaus.

Intermontane Plateau- These are the most proliferated and complex of all the plateau types. Intermontane plateaus are wide tablelands that are formed or situated between mountain ranges when a plateau is surrounded by mountains on all sides. Intermontane plateaus are landforms that are surrounded by mountain rims, these plateaus are enclosed by high mountain chains; they are the highest plateaus in the world. *The **Tibetan Plateau** is also known as **Qinghai-Tibetan** covers an area of approximately 2.5 million sq. km and has an average elevation of 4500 m. Chang Tang is located in the western and northern Tibet extending into the southern edges of Xinjiang as well as southeastern Ladakh (India). It is the highest plateau in the world and a good example of an intermontane plateau. *The **Pamir Knot** is known as the roof of the world.

Note: - The term roof of the world is first used for Pamir Knot, however it is now also used to refer to the Tibetan Plateau.

*The southern border of Central Asia is determined by the Pamir Knot. *The Pamir Plateau in Central Asia is at the junction of the **Himalayas** with **Tien Shan**, **Karakoram**, **Kunlun**, **Hindu Kush** and **Suleman ranges**. They are among the world's highest mountains. The Bolivia, Peru and Colombia Plateaus of South America and the Mexican Plateau of Mexico are also some examples of Intermontane Plateaus.

Piedmont Plateau-The name Piedmont comes from the French term for the same physical region, literally meaning 'foothill', ultimately from Latin "Pedemontium" meaning at the foothills of mountains.

*The Piedmont Plateau region located in the Eastern United States and the Patagonia Plateaus of South America are great examples of Piedmont Plateaus. The Patagonia Plateau of South America is very rich in mineral resources.

Domed Plateaus- These are formed when a landmass is uplifted by folding into a broad dome. The Plateau of Ozark (USA) is a good example of a domed Plateau.

Continental Plateau- A Continental Plateau is a broad protuberance of the surface of the lithosphere coinciding approximately with a continent but including also the continental shelf. The Indian Peninsula, the Arabian Plateau, Plateau of Australia and the South African Plateau etc. are examples of Continental Plateaus. *The **Iberian Peninsula** also known as Iberia is located in the southwest corner of Europe. The peninsula is principally divided between Spain

and Portugal, comprising most of their territory. It is the second largest European peninsula, after the **Scandinavian Peninsula**. The **Meseta plateau** of the Iberian Peninsula is located in Spain and has an average elevation of 610-760 m. The capital of Spain Madrid is located at its center.

Coastal Plateau- A plateau located near sea coasts is classified as a Coastal Plateaus. India's Coromandel Coast is an example of a Coastal Plateau.

Volcanic Plateau- A volcanic plateau is a plateau produced by volcanic activity. Chiefly there are two types:

- (a) **Lava Plateaus-** formed by highly fluid basaltic lava during numerous successive eruptions through numerous vents without violent explosions.
- (b) **Pyroclastic Plateau-** Plateaus are produced by massive pyroclastic flow and they are underlain by pyroclastic rocks: agglomerates, tephra, volcanic ashes cemented into tuffs, the magic of felsics. Pyroclastic Plateaus are also called ignimbrite plateaus.

*Plateaus of New Zealand, South Africa, North and South Argentina, Brazil, Western USA, Mexico, France and Siberia are some examples of a Volcanic Plateaus. The Plateau of Peninsular India is also an example of a Volcanic Plateau.

1. The average elevation of Tibetan Plateau above sea level is –

- (a) 2 Km
- (b) 3 Km
- (c) 4 Km
- (d) 5 Km

U.P.U.D.A./L.D.A. (Pre) 2013

I.A.S. (Pre) 1994

Ans. (d)

Tibetan Plateau is also known as the Qinghai-Tibetan Plateau. Its total area is about 2.5 million square kilometers and an average elevation is more than 4500 meter. Thus, the closest answer is option (d).

2. The area which is the 'storehouse of minerals' in South America is:

- (a) Brazilian Plateau
- (b) Bolivian Plateau
- (c) Patagonia Plateau
- (d) Orinoco basin

R.A.S./R.T.S.(Pre) 2010

Ans. (c)

Patagonia Plateau is called as the storehouse of minerals, in South America.

3. A city situated on a Plateau is –

- (a) Bucharest
- (b) Madrid
- (c) Jamnagar
- (d) Singapore

R.A.S./R.T.S. (Pre) 1992

Ans. (b)
