

According to IPCC global warming will result in the melting of glaciers, an increase in the level of seawater, floods and droughts will become more severe; the intensity of storms will increase etc.

19. Match List- I with List- II and select the correct answer using the code given below the lists :

List- I	List- II
(Typhoon/Hurricane August-September, 2019)	(Most Affected Country)
A. Dorian	1. Bahamas
B. Hagibis	2. China
C. Lekima	3. Jeju, South Korea
D. Mitag	4. Japan

Code :

	A	B	C	D
(a)	1	2	4	3
(b)	1	4	2	3
(c)	4	2	3	1
(d)	3	4	2	1

U.P.P.C.S. (Pre) 2019

Ans. (b)

The correct match of List-I and List-II is :

List- I	List- II
(Typhoon/Hurricane August-September, 2019)	(Most Affected Country)
Dorian	Bahamas
Hagibis	Japan
Lekima	China
Mitag	Jeju, South Korea
So, the correct answer is option (b).	

The Humidity

*The water vapor present in the atmosphere is known as humidity. Humidity is a result of evaporation of water from the earth surface which reaches the atmosphere. Humidity is expressed in two ways –

Absolute Humidity – it is the amount of humidity present per cubic meter of air at a given temperature.

Relative Humidity – it is expressed as a percentage. It is a measure of the actual amount of water vapour in the air compared to the total amount of vapour that can exist in the air at its current temperature. Relative Humidity is inversely proportional to the temperature of the air. Humidity decreases from the equator towards poles.

1. **Assertion (A)** : The amount of moisture in the atmosphere is associated with latitude.

Reason (R) : The ability to keep the moisture in the form of water vapour is related to temperature.

Code :

- (a) Both (A) and (R) are true, and (R) is the correct explanation of (A).
- (b) Both (A) and (R) are true, but (R) is not the correct explanation of (A).
- (c) (A) is true, but (R) is false.
- (d) (A) is false, but (R) is true.

I.A.S. (Pre) 2006

Ans. (a)

Measure of water vapor present in the air is known as humidity. Humidity in the atmosphere is mainly related to temperature. So reason (R) is correct. Moisture/water vapour content decreases with an increase in latitude, that is, in tropical region humidity is 2.6%, at 50° latitude it is 0.9% and at 70° latitude it is 0.2% only. The atmosphere contains 90% moisture up to 5 km height from the ground. So the assertion (A) is also correct. Humidity is directly proportional to temperature, that is at higher temperatures air can hold more water vapour than the same amount of air at lower temperatures, so reason (R) is the correct explanation assertion (A).

2. **Humid heat is experienced in summer when the weather is :**

- (a) Raw
- (b) Keen
- (c) Scorching
- (d) Muggy

U.P.U.D.A./L.D.A. (Pre) 2002

Ans. (d)

Humidity is the amount of water vapour in the air. In summer, humidity is very high therefore weather is muggy. Absolute humidity is the weight of water vapour per unit volume, usually expressed in grains per cubic foot.

3. **Humidity is the result of :**

- (a) Evaporation
- (b) Transpiration
- (c) Presence of heat
- (d) Presence of moisture in the air

Jharkhand P.C.S. (Mains) 2016

Ans. (d)

Humidity is the result of the presence of moisture in the air. Significantly, the water vapour present in the atmosphere is called 'humidity'.
