

16. Which of the following is not correctly matched ?

| Ports          | Country           |
|----------------|-------------------|
| (a) Rotterdam  | - The Netherlands |
| (b) Igarka     | - China           |
| (c) Montevideo | - Uruguay         |
| (d) Jakarta    | - Indonesia       |

U.P.P.C.S. (Pre) 2016

Ans. (b)

Igarka is a town in Turukhansky District of Krasnoyarsk Krai, Russia, not in China. Rest of the ports are correctly matched with their respective countries.

17. Who wrote Periplus of the Erythraean Sea?

- |                                                  |            |
|--------------------------------------------------|------------|
| (a) Ctesias                                      | (b) Pliny  |
| (c) Ptolemy                                      | (d) Strabo |
| (e) None of the above/More than one of the above |            |

64th B.P.S.C. (Pre) 2018

Ans. (e)

The Periplus of the Erythraean Sea or Periplus of the Red Sea is a Greco-Roman periplus written in Koine Greek that describes navigation and trading opportunities from Roman Egyptian ports like Berenice Troglodytica along the coast of Red Sea and others along the Horn of Africa, the Sindh region of Pakistan, along with southwestern regions of India. The text has been ascribed to different dates between the first and the third century. A mid-first century date is now the most commonly accepted.

While the author is unknown, it is clearly a first-hand description by someone familiar with the area and is nearly unique in providing accurate insights into what the ancient European world knew about the lands around the Indian Ocean.

## The Mapping

\*Maps provide us with relevant information regarding regional, territorial and local changes. \***Isopleth maps** provide us information about regions or areas having continuous distribution. Thus isopleths are lines joining places of equal value of quantity, intensity, equal pressure, equal temperature, equal rainfall, equal salinity etc. A very relevant and precise data is required for drawing the lines of isopleths. If there is equitable distribution of the given subject then isopleths become very useful. Moreover, the use of isopleths becomes difficult if the subject is in constant fluctuation for exp. population density. \***Contours** represent

elevation topography in comparison to the sea level. It is the most practical and widely used method in showing elevations on a map. When the contours of Isotypes are drawn very close to each other then it signifies steep slopes. **Isohypse** - isohypse or height contour is a line of equal geopotential height, which are shown on a constant pressure surface. **Isogonic** lines show the earth's magnetic declination on a map. **Isobaths** are imaginary lines, a map that links points at the same depth below the water surface. \***Isobars** are imaginary lines drawn on the maps that links areas having equal air pressure at mean sea level. \***Isohyets** are lines on the map joining areas having an equal amount of rainfall. \***Isonifs** are lines on the map joining areas having an equal amount of snowfall. \***Isohalines** are lines on the map joining areas having an equal amount of salinity. \***Ferdinand Magellan** was a Portuguese explorer and the first person to circumnavigate the world.

1. Daily weather map showing isobars is an example of :

- Choropleth map
- Isopleth map
- Chorochromatic map
- Choroschematic map

I.A.S. (Pre) 1997

Ans. (b)

An Isopleth map generalizes and simplifies data with continuous distribution. It shows the data as the third dimension on the map. Thus, isopleth maps are more common for mapping surface elevation, amounts of precipitation, atmospheric pressure and numerous other measurements that can be viewed statistically as a third dimension. It is an example of a daily weather map.

2. Isogonic lines are :

- Same atmospheric pressure lines
- Same temperature lines
- Same salinity lines
- Same magnetic declination line

U.P. Lower Sub. (Pre) 1998

Ans. (d)

An imaginary line or a line on a map joining points on the Earth's surface at which the magnetic declination is the same called, isogonic.

3. Isobaths are used to show –

- |              |              |
|--------------|--------------|
| (a) Rainfall | (b) Pressure |
| (c) Time     | (d) Depth    |

Chhattisgarh P.C.S. (Pre) 2003

Ans. (d)
